The game could be fun but at this point it's not. In the video on the Steam store you can see the flickering in the game, I thought it would be a possibility to turn it off or have a fix for that but there isn't. You get a major headache after playing this game for more than 10 minutes without a break. If you have epilepsy, do not play this game! There are no instructions. WASD are your controls, mouse controls the camera and E interacts with stuff. If the flickering graphics would be fixed I'd recommend it for the low price but unless you're looking for software to test if you're inclined to get a seizure, skip this one.. The game could be fun but at this point it's not.
